/mole="Wetcor: pSL1180; Site 1: BCORI; Site 2: XhoI; The library was prepared from polyA+ RNA from drought-stressed loblolly pine (Pinus taeda) roots. Warer was withheld from ramet clones until predawn needle warer potential reached -1.75 MPa. On day 7 roots were harvested for RNA isolation. Double-stranded cDNA was cloned unidirectionally into pSL1180. Inserts excised with ECORI (5' end) and XhoI (3' end)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RNA prepared and library constructed by W. Walter Lorenz, School of Forestry, University of Georgia; plant material prepared at the University of Florida; sequencing done in the Laboratory for Genomics and Bioinformatics, University of Georgia. Sequence ends have been trimmed to exclude vector and regions below Phred quality 16. Three-prime sequences are presented as their reverse complement and have been trimmed to exclude polyA. Seq prime: JENREV (CAGGAAACAGCTATGACC).

The present sequence represents a specifically claimed antigenic protein isolated from the fungus Malassezia. The antigenic protein can bind to IGE antibodies present in patients with allergic conditions. Antigenic proteins, peptides and nucleic acids from the fungus Malassezia can be used in the diagnosis, treatment and prevention of allergic conditions due to Malassezia organisms (such as M.furfur, M. sympodials and M.pachydermatitis). (Updated on 27-AUG-2003 to correct OS field.)

The antigenic protein can bind to IGE antibodies present in patients with allergic conditions. Antigenic proteins, peptides and nucleic acids from the fungus Malassezia can be used in the diagnosis, treatment and prevention of allergic conditions due to Malassezia organisms (such as M.furfur, M. sympodialis and M.pachydermatitis). method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polynuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Novel hMnSOD proteins having catalytic activity which differs from this natural hMnSOD are claimed (see AAW98171-77). The modified proteins exhibit reduced or no product inhibition, or have greater activity, or both, compared to natural hMnSOD. The modifications involve one or amino acid substitutions within the active site of the enzyme, especially at residues His-26, His-30, Tyr-34, His-74, Gln-143, Asp-159, Trp-161 and His-163. The modified hMnSOD, or expression vectors in which modified hMnSOD nucleic acid is linked to a promoter (preferably mammalian), can be used to protect a cell line from damage caused by superoxide radicals (claimed). They can also be used to treat subjects suffering from, or at risk of, cycloxicity caused by superoxide radicals (claimed). As such, they can be used as antioxidants in the treatment of a variety of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein (hAm SÖD). The specification describes a modified hAm SOD which has a catalytic activity which differs from natural hAm SOD in that it exhibits reduced or no product inhibition compared to natural hAm SOD. The natural hAm SOD is especially modified with one or more substitutions in amino acids 26, 30, 34, 74, 143, 159, 161 and 163. The modified hAm SOD is useful for protecting a cell from damage caused by superoxide radicals and for treating a cell from damage caused by superoxide validation and superoxide radicals. The protein is useful for treating inflammation and

                                            The sequence is of a maganese superoxide dismutase which can be used to catalyse the reduction of superoxide (SO) radicals to hydrogen peroxide and molecular oxygen. It can be used to reduce reperfusion injury following ischaemia and prolong the survival of excised organs. It can also me used as a long acting anti-inflamatory drug. (Updated on 25-MAR-2003 to correct PF field.)

```
The sequence represents a human manganese superoxide-dismutase (MnSOD), phage lambda-g10 in Bscherichia coli, by screening with a 5-probe (AAT15591) and a 3'-probe (AAT15591), followed by subcloning in plasmid pBR322 to give plasmid pMS8-4. The cDNA may be expressed in e.g. E. coli for production of recombinant MnSOD. The MnSOD product may be cleaved with Aeromonas proteolytica aninopeptidase to produce an N-terminally truncated analogue may be used in therapy of conditions associated with generation of oxygen free radicals, particularly synovial inflammetion, arthritis, and lung fibrosis (claimed). Human manganese superoxide dismutase (MnSOD) (AAW00018) catalyses the reduction of superoxide radicals to H2O2 and O2. Recombinant MnSOD can be obtd. using transformed host cells, sep. Bscherichia coli cells contg. a plasmid carrying e.g. a cDNA clone (AAT34277) obtd. from a human T-cell library. The MnSOD is useful for reducing reperfusion injury, treating linflammeation or bronchial pulmonary dysplasia and for prolonging survival of excised organs. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of recombinant human manganese super:oxide dismutase - for treating inflammation or bronchial pulmonary dysplasia, reducing reperfusion
                                                                                                                                               Manganese superoxide dismutase; MnSOD; reperfusion injury; ischaemia; bronchial pulmonary dysplasia; inflammation; antiinflammatory.

This protein is human manganese superoxide dismutase (hMnSOD). Novel
hMnSOD proteins having catalytic activity which differs from this natural
hMnSOD are claimed (see AAWBATI-77). The modified proteins exhibit
reduced or no product inhibition, or have greater activity, or both,
compared to natural hMnSOD. The modifications involve one or amino acid
substitutions within the active site of the erazyme, especially at
residues His-26, His-30, Tyr-34, His-74, Gln-143, Asp-159, Trp-161 and
His-163. The modified hMnSOD, or expression vectors in which modified
hMnSOD nucleic acid is linked to a promoter (preferably mammalian), can
be used to protect a cell line from damage caused by superoxide radicals
(claimed). They can also be used to treat subjects suffering from, or at
isk of, cyctoxicity caused by superoxide radicals (claimed). As such,
they can be used as antioxidants in the treatment of a variety of
disorders, including inflammation (claimed), reperfusion injury following
ischemia (claimed), and cellular damage caused by chemotherapeutic agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      64 NAABESYSAAVGKEDVLTQVKLQSALKFNGGGHINHSLFWKNLAPYGSEEATLSEGPLKK 123

This sequence comprises both prepro- and mature-manganese super- oxide dismutase (MSOD). It is encoded by the sense strand of a double-stranded molecule contained in a recombinant vehicle. This recombinant MSOD catalyses the reaction of hydrogen ions and the SOD radical anion to form hydrogen peroxide and water. It is useful in veterinary and pharmaceutical compens. for eq reducing lesions of reperfusion following ischaemia, to prolong survival lime isolated organs and for treating inflammation. See also AANN1371-72. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This protein is a Q143E mutant of human manganese superoxide dismutase (hmmSDD, see also AAW98170). Novel modified hmmSDD proteins having catalytic activity which differs from natural hmmSDD are claimed. The modified proteins (see also AAW98177) exhibit reduced or no product inhibition, or have greater activity, or both, compared to natural hmmSDD. The modifications involve one or amino acid substitutions within the active site of the enzyme, especially at residues His-26, His-30, Tyr His-74, Gln-143, Asp-159, Trp-161 and His-163. Gln-143, Tyr-34 and His-30 are located near the active site metal, are highly conserved, and are involved in a hydrogen bond relay which links the active site metal-bound hydroxyl group to ordered solvent, and are thus all potentially involved in adalytic activity, product inhibition and/or enzyme stability. Modified hwmSODs, or expression vectors in which a modified hwmSOD sucleic acid is linked to a promoter (preferably mammalian), are used to protect a cell line from damage caused by superoxide radicals (claimed). They can also be used to treat subjects suffering from, or at risk of, cytotoxicity caused by subseroxide radicals (claimed). As such, discrets they can be used as antioxidants in the treatment of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety of a variety
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            disorders, including inflammation (claimed), reperfusion injury following ischemia (claimed), and cellular damage caused by chemotherapeutic agents. Note. The present sequence is not shown in the specification but is derived from the hMnSoD sequence given on page 53-54

decomposition of the superoxide anion to peroxide. Agents such as superoxide dismutase are able to increase the salvage of heart muscle cells. The SOD gene (AAT31018) can be used in novel therapeutic constructs also contg. a tissue-specific promoter and a hypoxia response enhancer element. Expression of the gene is enhanced in the target tissue under hypoxic conditions, such as those encountered during ischaema and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        64 NAAEESYSAAVGKEDVLTQVKLQSALKFNGGGHINHSLFWKNLAPYGSEEATLSEGPLKK 123

                                                  Human manganese superoxide dismutase or its analogues or mutants is used generation of oxygen free radicals, eg reperfusion injury following ischaemia or organ transplant, inflammation caused by Crohn's disease or colitis, synovial inflammation induced by bacterial lipopolyyaccharide endotoxin, arthritis, bronchial pulmonary displassia or lung fibrosis by radiation or an anti-neoplastic agent, eg bleomycin. It can also be used to prolong the life of excised organs. As it remains in the serum for long periods, it may be used as a long-acting therapeutic agent. Dosage is 1-200 mg/joint or 1-100, esp. 3-50, mg/kg body wt. daily. It is given intra-articularly, intratracheally, sc or iv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Recombinant human manganese superoxidedismutase - used for treating e.g. reperfusion injury, inflammation, arthritis, bronchial pulmonary dysplasia or lung fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NAAEESYSAAVGKEDVLTQVKLQSALKFNGGGHINHSLFWKNLAPYGSEEATLSEGPLKK

(claimed). They can also be used to treat subjects suffering from, or at risk of, cytotoxicity caused by superoxide radicals (claimed). As such, they can be used as antioxidants in the treatment of a variety of disorders, including inflammation (claimed), reperfusion injury following ischemia (claimed), and cellular damage caused by chemotherapeutic agents
 are involved in a hydrogen bond relay which links the active site metalbound hydroxyl group to ordered solvent, and are thus all potentially involved in catalytic activity, product inhibition and/or enzyme stability. The particularly preferred GHIJN mutant has a kcat of 0.3 m/sec and a kcat/km of 0.82/uM.sec compared to respective values of 40 m/sec and 800/uM.sec for wild-type hMmSOD. It exhibits no product inhibition. Modified hMmSODs, or expression vectors in which a modified hMmSOD nucleic acid is linked to a promoter (preferably mammalian), are used to protect a cell line from damage caused by superoxide radicals (claimed). They can also be used to treat subjects suffering from, or at

Novel modified hMmSDD proteins having catalytic activity which differs from natural hMmSDD proteins described. The modified proteins (see also AAM98172-77) exhibit reduced or no product inhibition, or have greater activity, or both, compared to natural hMmSDD. The modifications involve one or amino acid substitutions within the active site of the enzyme, especially at residues His-26, His-30, Tyr-34 and His-30 are located near the active site metal, are highly conserved, and

```

This protein is a Q143D mutant of human manganese superoxide dismutase (hmmSDD, see also AAW98170). Novel modified hmmSDD proteins having catalytic activity which differs from natural hmmSDD are claimed. The modified proteins (see also AAW9817-77) exhibit reduced or no product inhibition, or have greater activity, or both, compared to natural hmmSDD. The modifications involve one or amino acid substitutions within the active site of the enzyme, especially at residues His-26, His-30, Tyr-16, His-30 are located near the active site metal, are highly conserved, and are involved in a hydrogen bond relay which links the active site metal-common hydroxyl group to ordered solvent, and are thus all potentially cound hydroxyl group to ordered solvent, and are thus all potentially containty. Modified hmmSODs, or expression vectors in which a modified hmmSODs, or expression vectors in which a modified hmmSOD contained to a promoter (preferably mammalian), are used to protect a cell line from damage caused by superoxide radicals (claimed). They can also be used to treat subjects suffering from, or at tisk of, cytotoxicity caused by superoxide radicals (claimed). They can also be used to treat subjects suffering from, or at tisk of, cytotoxicity caused by superoxide radicals (claimed). They can also be used to treat subjects suffering from, or at tisk of, cytotoxicity caused by superoxide radicals. disorders, including inflammation (claimed), reperfusion injury following ischemia (claimed), and cellular damage caused by chemotherapeutic agents. Note. The present sequence is not shown in the specification but is derived from the hMnSOD sequence given on page 53-54
